Developers Assessments

How effective are **generalist models** in predicting developers' subjective assessments of code readability

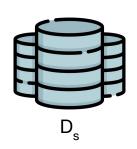

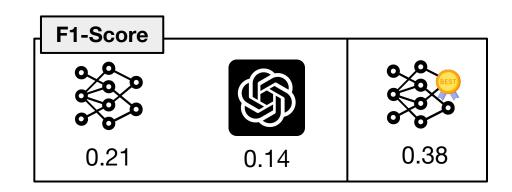

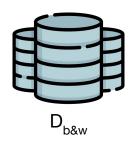

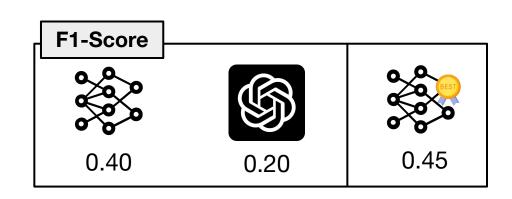

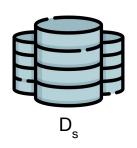

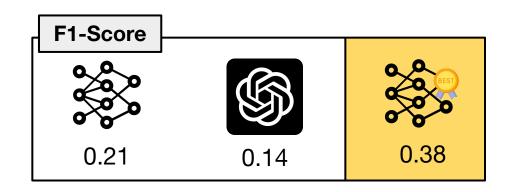

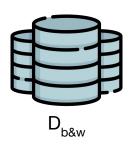

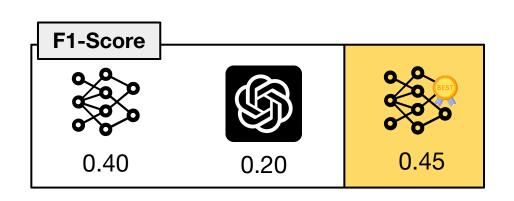

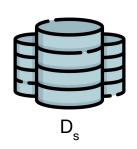

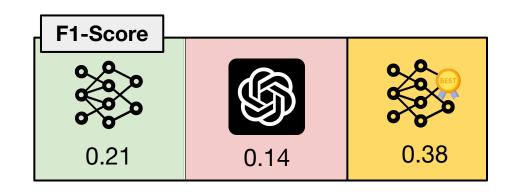

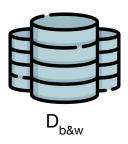

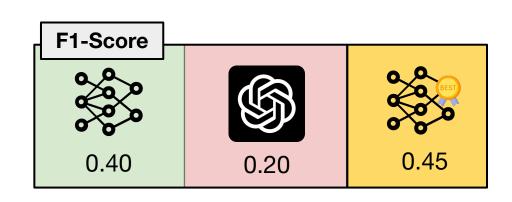

Generalist models are not effective for personalized code readability assessments.

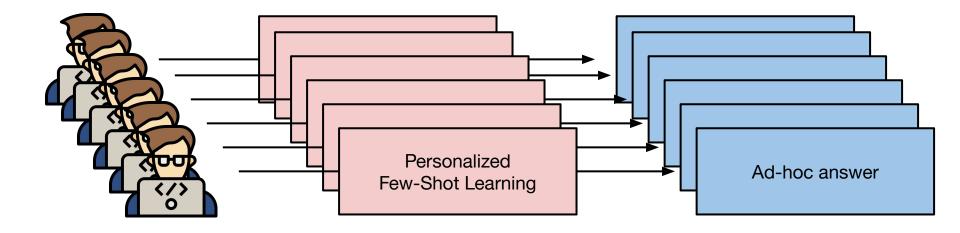

Generalist models are not effective for personalized code readability assessments.

Generalist LLM achieves lower performance than a significantly smaller, feature-based model tailored for readability predictions.

How effective is an LLM-based personalized code readability assessment model in predicting developers subjective assessments of code readability?

MODEL INPUT

You are an expert and personal code readability labeler.

Your role is to assign a code readability label based on the already known preferences of the developer. The labels you can assign are: *Unreadable*, *Neutral*, and *Readable*.

Below you find examples of the already known developer preferences.

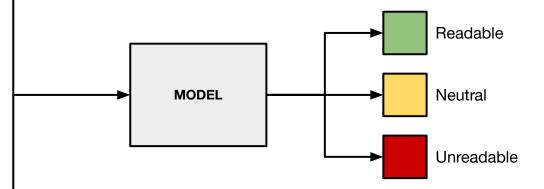

0-shot

Personalized LLM-based code readability models are **less effective** than a state-of-the-art generalist model.

To what extent are developers' code readability assessments **consistent**

384 samples

Developers code readability assessments show moderate consistency, with 32% inconsistency in ${\bf D_{b\&w}}$ and 23% in ${\bf D_{s}}$.

OUTCOMES

The definition of personalized code readability prediction models is worth future investigation.

OUTCOMES

The definition of personalized code readability prediction models is worth future investigation.

Future work should aim at using more principled procedures for defining code readability datasets.

SUMMARY
